# Underground packer UP - UPN - DP 

Professional Packer Technology

- Advantage through Experience

## The principle

The principle of the packer is based on the spreading effect of the wedge-shaped ring cutting edges which, when the rings penetrate, not only causes the fragmentation of the clods but also compresses the soil between the rings to the depth of the crumb. This results in optimum reconsolidation for the seedbed and a reduction in the track depth during subsequent operations.

## The ring shapes

While in lighter and medium soils great importance is attached to reconsolidation, in heavy soils the cutting of the slabs is more important. Therefore: large ring diameter with wide cutting edge for light soils and small ring diameter with slim ring cutting edge for heavy soils. The decisive factor for the penetration depth is therefore not only the weight of the individual packer ring but also its cutting-edge geometry. Another important factor for the working result is the ring distance. A narrow ring spacing reduces the penetration depth, improves the packing effect in the upper layers, but increases the risk of clogging. Conversely, a large ring spacing has the opposite effect.

Packer rings $\emptyset 900$ mm

| Typ | W 160 | W 300 | W 302 |
| :--- | :---: | :---: | :---: |
| Soil | various | light-medium |  |
| Ring profile | $40^{\circ}$ | $50^{\circ}$ |  |
| Shoulder | 55 mm | 65 mm | 60 mm |
| Weight | 68 kg | 74 kg | 74 kg |

## The technology

- High resilient quality castings from own production - High-strength shafts with low-maintenance ball bearings
- Movable cleaning chains for clog-free operation
- Standard with three-point mounting frame category II (except N50 / N55 and DP 900 III)

As one of the pioneers in the field of packer technology, TIGGES has decades of experience at its disposal and, together with new practical findings, consistently translates this into advantageous technical solutions.

## UNDERGROUND PACKER

## Benchmark for economical soil cultivation

## Extensibility

TIGGES packers (except DP 900 III) have a telescopic base frame which allows the working width to be extended by installing additional rings and new shafts.

## Draw arm system

The length and height of the draw arms can be adjusted to suit the plough and the operating conditions. In addition, they are spring mounted in height, so that even when a plough with a high clearance is inserted, the height is automatically adjusted.

The standard shock absorbers protect the plough and packer during trapping and on clumsy soils. The swivel joints are equipped with adjustable brakes to prevent the arms moving away when the plough arm is approaching quickly and to prevent them from sliding off on side slopes.

## Tow hooks

Tigges offers the right tow hook for every plough brand or release system.

## Long-travel device

For road transport, the double packers over 280 cm working width are optionally available with a hydraulic long-travel device. They are attached to the lower links via a telescopic drawbar. This means that even large working widths can be transported in accordance with the StVO (German road traffic regulations).

TIGcES

# Underground packer UP - UPN - DP 

Underground packer UP 900

## Application area:

For use on very light to medium, pourable soils with a low tendency to stick.

## Basic equipment:

- Ring type W 300
- expandable telescopic frame
- from 230 cm fourfold shaft bearing
- Trunnion for trailing roller

## Application area:

Same application as UP900, but with additional near-surface reconsolidation and fine crumbling by the trailed roller.

## Basic equipment:

- Ring type W 300
- With a cam roller $\emptyset 500 / 550 \mathrm{~mm}$ with a telescopic drawbar and semi-mounted equipment (favourable transportation balance point)

## Application area:

- DP 700
with ring type W 280-30
for medium to heavy soils
- DP 700 S with ring type W 305 $30^{\circ}$ for heavy to very heavy soils
- DP 700 B with ring type W 281 $45^{\circ}$ for light to medium soils
- DP 900 with ring type W 160 $40^{\circ}$ for varying soils
- DP 900 S with ring type W 300 $50^{\circ}$ for light to medium soils

## Additional equipment:

- Pull chain for conventional plough, 2 strands
- High-adjustable tow hooks with support brackets and swivel brakes, standard with shock absorbers.

## Additional equipment:

- Pulling chain for conventional plough, 3 strands
- Spring-loaded tow hooks height adjustment and swivel brakes, standard with shock absorbers.

## Basic equipment:

- Expandable telescopic frame
- from 285 cm fourfold shaft bearing
- Trunnion for trailing roller

## Additional equipment:

- Pull chain for conventional plough, 2-strands
- Spring-loaded tow hooks with height adjustment and swivel brakes, standard with shock absorbers
- Hydraulic long-travel device

## UNDERGROUND PACKER

## UNDERGROUND PACKER

## Benchmark for economical soil cultivation

## REAR-TRAILED ROLLER

## Cam roller N 50/55

For use on light to medium-heavy soils as an ideal combination supplement to the packer.

DP 900 with N 50

- Easy handling without influence on the turning process
- Additional reconsolidation also in the near-surface area
- Optimum crumbling with erosion-inhibiting seedbed structure
- Extendable in working by unilateral wheel bearing
- From 350 cm working with triple shaft bearings
- Self-cleaning roller with scraper, individually replaceable

## Design variants:

- Basic unit without attachments
- Standard drawbar for packer draw
- Telescopic drawbar with coupling device for transportation
- Transport wheels with lifting kinematics
- Swivel roller for lager working widths
